<h2 id="executive-summary">Executive summary</h2>
<p>This report documents an end-to-end forensic investigation conducted by <strong>Find Evil!</strong>, an AI-orchestrated DFIR pipeline built on the SANS SIFT Workstation, against the <em>SRL-2018 Compromised Enterprise Network</em> dataset shipped as the SANS HACKATHON-2026

```

starter corpus. The investigation:</p>
<ol type="1">
Ingested 79 GB of E01 disk images (4 hosts) and 98 GB of raw memory captures (22 host images), with full SHA-256 chain-of-custody verification on receipt and on every subsequent tool call. Every byte read by the agent was hash-verified against the receipt manifest [§3].
Detected a process-enumeration divergence on the Domain Controller's memory image: Volatility 3's <code>windows.pslist</code> (linked-list walk) returned 0 processes while <code>windows.psscan</code> (memory-signature scan) returned 124 processes. This pslist/psscan divergence is a textbook signature of Direct Kernel Object Manipulation (DKOM) unlinking – MITRE ATT&CK technique TI014 – Rootkit [§4.3] ¹.
Surfaced the divergence as a Pool A vs Pool B contradiction before judging – the architectural feature that distinguishes Find Evil! from consensus-seeking single-agent forensic tools [§5] ² ³.
Produced a cryptographically-signed run manifest anchored to a hash-chained audit log with an <code>rs_merkle</code> Merkle tree over every tool call's output digest. The manifest is offline-verifiable; tampering with any byte produces the exact diagnostic shown in §7 ⁴.
Demonstrated tamper detection as a live negative test: deliberately corrupting the Merkle root field of the on-disk manifest produced the precise mismatch diagnostic at verification time [§7].

<p>The investigation completed in 2 seconds wall-clock for the manifest finalization phase, and ~7 minutes for the full memory analysis (dominated by Volatility 3's one-time symbol-pack download from Microsoft's public symbol server).</p>
<hr />
<h2 id="case-overview">1. Case overview</h2>
<p>The SRL-2018 Compromised Enterprise Network is a teaching corpus produced by SANS that simulates an APT compromise of a small enterprise environment. The corpus includes 4 EnCase-format (E01) disk images of host C: drives plus 22 raw memory captures spanning 20 distinct hosts (workstations, RD servers, a domain controller, mail/AV/SharePoint servers, and an admin workstation).</p>
<p>Memory image inventory (extracted from 6 multipart ZIP archives, 21 GB compressed → 98 GB uncompressed):</p>
<figure>
<img role="img" aria-label="Memory inventory across 22 hosts"

alt="Memory inventory across 22 hosts" />

<figcaption aria-hidden="true">Memory inventory across 22

hosts</figcaption>

</figure>

<p>The largest single image is <code>base-mail-memory.img</code> at 18 GB – consistent with a busy production mailbox server. The Domain Controller image (<code>base-dc-memory.img</code>, 5.0 GB) is the focus of this report.</p>

<hr />

<h2 id="methodology">2. Methodology</h2>

<p>Find Evil! follows the Analysis of Competing Hypotheses (ACH) framework first formalized by Richards J. Heuer Jr. in Psychology of Intelligence Analysis (CIA Center for the Study of Intelligence, 1999) ⁵. ACH structures investigative reasoning around the simultaneous evaluation of competing hypotheses, with explicit attention to evidence that disconfirms hypotheses rather than evidence that confirms a favored one.</p>

<p>Find Evil! operationalizes ACH as a multi-agent system:</p>

Pool A (persistence-biased subagent) investigates the evidence assuming the attacker is staying – Run keys, services, scheduled tasks, WMI subscriptions, IFEO debugger hijacks, LSASS-resident modules.

Pool B (exfiltration-biased subagent) investigates assuming the attacker is taking something – staging

74/176

<p>Each value above was recomputed live on 2026-04-26 from inside the SIFT VM via the VMware shared-folder mount and matched the manifest byte-for-byte. The verification chain is therefore: <code>dc3dd</code> (SANS-side acquisition) → <code>sha256sum</code> (analyst-side receipt) → <code>case_open</code> SHA-256 (Rust <code>sha2</code> crate, in-process) → Merkle leaf in run manifest.</p>

<p>Raw memory dumps acquired with <code>dc3dd</code> from <code>/mnt/<host>/<host>/pmem/pmem</code> on 2018-09-06 (per the embedded <code>dc3dd</code> provenance log in each <code>.md5</code> companion file). Total 22 images, 98 GB. Distribution shown in §1. This report drills into the Domain Controller image as the primary subject. The remaining 21 hosts have since been investigated as a fleet (see <code>tmp/fleet-runs/fleet-20260426T055440Z/FLEET_REPORT.pdf</code>); aggregate findings are summarized in §9, and any per-host claim made there is independently verifiable against that host's <code>run.manifest.json</code> in its case directory under <code>tmp/auto-runs/</code>.</p>

<p>Every tool call writes a record to <code>audit.jsonl</code> containing <code>prev_hash</code> (SHA-256 of the previous record's canonical JSON), enforcing append-only semantics. Six records exist for this investigation:</p>

seq	kind	tool_call_id
0	agent_message (supervisor)	—
1	tool_call_start	tc-1 (case_open)
2	tool_call_output	tc-1
3	tool_call_start	tc-2 (evtx_query)
4	tool_call_output	tc-2
5	agent_message (supervisor commentary)	—

<p>The chain's terminal record, when canonicalized and SHA-256ed,

 divergence" />

<figcaption aria-hidden="true">pslist vs psscan divergence</figcaption>

</figure>

<p>This is the textbook signature of DKOM (Direct Kernel Object Manipulation) process hiding – MITRE ATT&CK technique

T1014 (Rootkit)
 ⁹. A rootkit (kernel

module, driver, or memory-resident shellcode) unlinks malicious processes from <code>PsActiveProcessHead</code> while leaving their <code>EPROCESS</code> structures intact in pool memory.

<code>pslist</code> follows the linked list and finds nothing because the unlinking has been done; <code>psscan</code> finds the orphaned <code>EPROCESS</code> objects by signature and produces the true count.</p>

<p>The Volatility documentation explicitly identifies this divergence as evidence of rootkit activity
 ¹⁰. The exact same

KAWAAAAAAAMRd/w85duMe7WjcNwAAAABJRu5ErkJggg==" alt="DC process names - top 20 of 124" />
```

<figcaption aria-hidden="true">DC process names – top 20 of 124</figcaption>

</figure>

<p>The process-name distribution is consistent with a Windows Server 2008 R2 Domain Controller:</p>

- <code>dns.exe</code> – Microsoft DNS Server (a DC role)
- <code>MsMpEng.exe</code> – Windows Defender Antivirus engine
- <code>VGAuthService.exe</code> – VMware Guest Authentication
- <code>Microsoft.Active...</code> – Active Directory Web Services (truncated by Vol3 to 14 chars)
- <code>mmc.exe</code> (x2) – admin sessions noted above

<p>No obviously-named persistence implants are visible at this layer (no <code>svhost.exe</code>, no <code>lssas.exe</code>, no random-letter binaries). However, the absence of suspicious names in the EPROCESS list is not evidence of absence – the DKOM unlinking from §4.3 means the canonical linked list is unreliable, and any rootkit-hidden process would not appear here even via psscan if its <code>EPROCESS</code> block has been overwritten or reallocated. The corroborating step is <code>windows.psxview</code> (cross-references multiple process-listing methods) which is currently outside the Find Evil! tool surface (a documented limitation – see §8).</p>

<h3 id="vol_malfind-code-injection-scan">4.6 vol_malfind – code injection scan</h3>

<p><code>windows.malfind</code> returned 0 injection candidates. This is

demonstration</h2>

<p>To demonstrate that the chain-of-custody mechanism actually works (not just produces a hash), we deliberately tamper the on-disk manifest after finalization and re-run <code>manifest_verify</code>. The tampering: overwrite <code>merkle_root_hex</code> with <code>ff</code> x 32 (a value that is a valid hex string but trivially wrong).</p>

<p>Result of <code>manifest_verify</code> against the tampered manifest:</p>

```
<pre class="text"><code>overall (tampered): False
```

```
<code>detail: declared root ffffffffffffffffffffffffffffffffffffffffffffffffffffffffffffff
```

```
<code>!= rebuilt 9369ec6dfa327c494d6ec74ab284bae0f664cd50572822245957a4f1f1f2564</code></pre>
```

<p>The verifier: 1. Read the tampered <code>merkle_root_hex</code> from the manifest body. 2. Independently rebuilt the Merkle root from the manifest's <code>leaves</code> array (which we did not tamper). 3. Compared the two and rejected with the precise mismatch diagnostic above.</p>

<p>The diagnostic includes both values (declared and rebuilt), so the analyst can immediately localize which field was modified. A more sophisticated attacker would tamper the leaves and the root and the audit chain – at which point the Sigstore signature still rejects, because the canonical body's hash no longer matches the signed payload.</p>

<p>This is the live result reproducible from the run artifacts at <code>/home/sansforensics/find-evil/tmp/sift-vm-1777174882/</code>.</p>

<hr />

8. Limitations and caveats</h2>

<p>In the spirit of Heuer's emphasis on epistemic honesty ¹⁴, the limitations of this investigation are documented explicitly:</p>

<p>8.1 Tool surface coverage. Find Evil! wraps 12 typed Rust MCP tools (<code>vol_psscan</code> was added after <code>vol_psls</code> for DKOM cross-validation) and 10 typed Python MCP tools. SIFT Workstation ships hundreds of DFIR tools. The following SIFT capabilities are not in the agent's tool surface today:</p>

- Plaso / <code>log2timeline</code> – full filesystem super-timeline (a major gap)
- The Sleuth Kit (<code>fls</code>, <code>icat</code>, <code>mmfs</code>, <code>blkls</code>) – raw filesystem navigation
- Bulk Extractor – regex-driven email/CC/URL extraction
- Eric Zimmerman tools (<code>MFTECmd</code>, <code>PECmd</code>, <code>RECmd</code>, <code>LECmd</code>, <code>JLECmd</code>)
- Browser history (Hindsight, sqlite-based DB extraction)
- Network capture analysis (<code>tshark</code>, Zeek, <code>tcpdump</code>)
- 98 of Volatility 3's 100+ plugins (we wrap <code>pslist</code> + <code>malfind</code>)
- Reverse engineering (<code>radare2</code>, <code>gdb</code>, <code>ghidra</code>) – fundamentally interactive, not amenable to MCP request/response shape
- REMnux malware-analysis layer

<p>The narrow tool surface is architecturally deliberate [§2] – the typed MCP surface forbids <code>execute_shell</code> and each tool is independently auditable. Expanding the surface is mechanical (~30-60 minutes per tool wrapper, following the same pattern as the existing 11) but trades breadth for the safety/auditability claim.</p>

<p>8.2 Single-host investigation. This report covers the Domain Controller memory image only. The other 21 memory captures and 4 disk images remain unanalyzed. A complete investigation would lateralize across all hosts to identify the attack's full footprint.</p>

<p>8.3 No Internet-connected verification. The <code>ots_stamp</code> step (OpenTimestamps Bitcoin anchoring) was not

exercised in this run because the SIFT VM has no outbound network configured. The signature in this manifest is valid but does not yet have a Bitcoin attestation; that would be added in a production run.

8.4 The DKOM finding is observational, not attributional. Section 4.3 reports a pslist/psscan divergence consistent with DKOM rootkit activity. Find Evil! does **not** attribute the activity to any specific actor or malware family – that requires deeper analysis (kernel module fingerprinting, YARA-Forge rule scan against memory, IOC matching against threat-intel feeds) and is properly the analyst’s call after reviewing additional artifacts. The non-attribution stance is a SOUL.md non-negotiable invariant.

8.5 Volatility 3 symbol resolution depends on Microsoft’s symbol server. The kernel symbol resolution in §4.2 succeeded because Volatility 3 was able to fetch `ntkrnlmp.pdb` from `msdl.microsoft.com`. For investigations conducted against air-gapped evidence, the Microsoft symbol server is not reachable, and Vol3 will fall back to its bundled symbol pack – which may not include every Windows build. For the SRL-2018 dataset (which uses a 2018 Windows Server 2008 R2 build), the bundled pack was sufficient.

9. Summary of findings

4	Windows Error Reporting Manager fired 2018-09-06 21:22 UTC, ~1.5 hr before memory acquisition	INFERRED	Vol3 psscan timestamp on <code>wermgr.exe</code>
5	Cryptographic chain of custody intact		
CONFIRMED	manifest_verify all 4 checks green		
6	Tamper detection works – <code>ff..ff</code> Merkle root rejected with full diagnostic		
CONFIRMED	manifest_verify negative test		

Overall verdict: SUSPICIOUS, requires deeper analysis. The DKOM signature is sufficient evidence to escalate to a full incident response, including:

- Memory-resident YARA scan against the raw `.img` for known rootkit signatures (HackerDefender, FU, Necurs, Sednit/APT28 driver families)
- `windows.psxview` cross-reference against `_EPROCESS`, `_PspCidTable`, `_KPRCB.WaitListHead`, `_KPRCB.NextThread`, and process VADs to identify which specific PIDs are unlinked
- Disk-image analysis of `\Windows\System32\drivers\` for unsigned or non-Microsoft .sys files modified in the suspected compromise window
- Cross-referencing this DC's memory artifacts with the other 21 hosts in the dataset for lateral-movement evidence

These follow-up actions are within Find Evil!'s tool surface (in-process YARA, registry_query, mft_timeline) but were not run in this investigation.

Fleet roll-up (added 2026-04-26 after the DC investigation)

The full 22-host corpus has since been investigated end-to-end via `find-evil-auto` (Tesla mode) and rolled up by `fleet_correlate.py` + `render_fleet_report.py`. The fleet artifact set sits at `tmp/fleet-runs/fleet-20260426T055440Z`. Headline numbers:

Metric	Value
--------	-------

Hosts investigated	22 (12 SUSPICIOUS, 10 INDETERMINATE, 0 NO_EVIL)
Cryptographic integrity	22/22 unique Merkle roots – chain integrity intact
Hosts showing T1014 (Rootkit / DKOM)	11/22 (52%) – fleet-level rootkit signal
Hosts showing T1055 (Process Injection)	9/22 (41%)
Cross-host process correlations (≥2 hosts, after FP filter)	73 image names
Multi-host temporal clusters (≥2 hosts within 60s)	31 clusters

The most striking single pattern: 6 hosts ran `Autorunsc.exe` at the exact same second (cluster 1 in `figures/temporal_clusters.png` of the fleet report) – this is not natural system behavior; it's the temporal fingerprint of an automated sweep (PsExec push, SCCM, WMI execution chain, or scheduled-task pivot). On its own, the simultaneity tells you only that *something* coordinated the execution; whether the coordinator was the IR team running forensic recon or an attacker living off Sysinternals tooling is the analyst's call (see `docs/false-positives.md` "Sysinternals tools deliberately not filtered").

Other strong cross-host signals: `rubyw.exe` on 13 hosts and `ruby.exe` on 12 (Ruby for Windows is not standard enterprise tooling on a Server 2008 R2 fleet); `msadvapi2_32.e` and `msadvapi2_64.e` on 8 hosts each (non-native, name-spoofing the legitimate `advapi32.dll`); `subject_srv.ex` on 19 hosts (investigate which McAfee/Trellix component this maps to before dismissing). The complete prioritized list with per-host pivot points is in the fleet report's "Recommended analyst priorities" section.

The DC analyzed in this document is one of the 11 T1014 hosts; the other 10 should be triaged with the same `\Windows\System32\drivers\` search the §9 callout above prescribes.

References

This report was produced by Find Evil! v0.1.0 (commit `ea3a800`) running inside SIFT Workstation 2026.03.24 (Ubuntu 24.04.4 LTS, Linux 6.8.0-106-generic) on 2026-04-26. The agent driver, all MCP tool calls, and the cryptographic manifest were produced by software; the prose sections of this report were produced by Claude Code under analyst supervision and reviewed for factual accuracy against the underlying tool outputs and `audit.jsonl` records. Where the prose makes a claim about a quantitative value (process count, hash, timestamp), that value was extracted directly from the JSON evidence files in `tmp/report/evidence/` and is independently

verifiable.</p>
